Art Unit: 2142

1. Claims 1-7, 11, 13-15, and 17-20 remain present for consideration.
2. Since *a* patent may only be granted on *an* invention (each in the singular), restriction to one of the following inventions is required under 35 U.S.C. 121 (see 37 CFR 1.141):

Group I. Claims 1-7 and 11, drawn to a method for increasing network transmission efficiency by increasing a data updating rate of a memory for increasing efficiency of a network interface circuit transmitting data to a network, the network interface circuit including a memory and a buffer for storing at least one packet to be transmitted to the network

Classified in Class 711, subclass 159.

Group II. Claims 13-15 and 17-20, drawn to a network interface circuit for controlling data access of a network by use of a checking circuit for generating an interrupt request signal

Classified in Class 370, subclass 463.

3. Inventions I and II are related as subcombinations disclosed as useable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately useable. In this instant case, invention of Group I has separate utility such as in a method for increasing network transmission efficiency by increasing a data updating rate of a memory for increasing efficiency of a network interface circuit transmitting data to a network, the network interface circuit including a memory and a buffer for storing at least one packet to be transmitted to the network not used in a network interface circuit for controlling data access of a network by use of a checking circuit for generating an interrupt request signal as claimed in Group II.

4. Inventions II and I are related as subcombinations disclosed as useable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately useable. In this instant case, invention of Group II has separate utility such as in a network interface circuit for controlling data access of a network by use of a checking circuit for generating an interrupt request signal not used in a method for increasing network transmission efficiency by increasing a data updating rate of a memory for increasing efficiency of a network interface circuit transmitting data to a network, the network interface circuit including a memory and a buffer for storing at least one packet to be transmitted to the network as claimed in Group I.

5. An undue burden would be placed upon examiner since the search each Group would be in class and subclass not required for the other Group.
6. Because these inventions are independently distinct from each other for the reasons given above and because they have acquired a separate status in the art as shown by their different

Art Unit: 2142

classification and their recognized divergent subject matter and the search for each Group is not required for the other Group, restriction for examination purposes as indicated is proper.

7. Applicant is advised that the response to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed.

8. The applicant is also advised that the response must be submitted to the Office *within ONE [1] Month* or 30 days, whichever is longest.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Robert B. Harrell whose telephone number is (571) 272-3895. The examiner can normally be reached Monday thru Thursday from 5:30 am to 2:00 pm.

10. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Andrew Caldwell, can be reached on (571) 272-3868. The fax phone number for all papers is (571) 273-8300.

11. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-9600.
